a) If A is a 2 \times 2 matrix and v is an eigenvector of A corresponding to an eigenvalue λ then 2v is an eigenvector of A corresponding to the eigenvalue 2λ . +5 False. The eigenvector 2v still corresponds to the eigenvalue t. Consider (A) below. b) If V is a subspace of \mathbb{R}^2 and \mathbf{w} is a vector such that $\operatorname{proj}_V \mathbf{w} = -\mathbf{w}$ then \mathbf{w} must be the zero vector. True, see B below. The promote of c) If A is a square matrix which is both symmetric and orthogonal then A^2 is the identity A + B is also orthogonally diagonalizable. By definition a matrix is orthogonally diagonizable is it is symmetric and every symmetric natrix is diagonizable, so the answer is true because any 2 × 2 natrix

for example:

[A C] + [DF] - [A+D C+F]

[C+F B+E] todded to nother symmetric natrix is still symmetric. TRUE. $\begin{bmatrix} 1 & 2 & 2 & 3 & 4 & 6 \\ 1 & 2 & 2 & 3 & 6 \\ 1 & 2 & 2 & 3 & 6 \end{bmatrix} \xrightarrow{X_1 = -2 \times 2} \begin{bmatrix} 2 & 2 & 2 & 2 \\ 2 & 2 & 3 & 6 \\ 1 & 2 & 3 & 6 \end{bmatrix} \xrightarrow{X_1 = -2 \times 2} \begin{bmatrix} 2 & 2 & 2 & 2 \\ 2 & 2 & 3 & 6 \\ 2 & 3 & 3 & 6 \end{bmatrix} \xrightarrow{X_1 = -2 \times 2} \begin{bmatrix} 2 & 2 & 2 & 2 \\ 2 & 2 & 3 & 6 \\ 2 & 3 & 3 & 6 \end{bmatrix}$ but $\begin{bmatrix} 4 & 2 & 3 & 2 & 2 \\ -1 & 2 & 3 & 6 \\ 2 & 3 & 3 & 6 \end{bmatrix} \xrightarrow{X_1 = -2 \times 2} \begin{bmatrix} 2 & 2 & 2 & 2 \\ 2 & 2 & 3 & 6 \\ 2 & 3 & 3 & 6 \\ 2 & 3 & 3 & 6 \end{bmatrix}$ but $\begin{bmatrix} 4 & 2 & 3 & 2 & 2 \\ -1 & 2 & 3 & 6 \\ 2 & 3 &$ that corresponds to &, not 21. FALSE possible unless w is the zero vector because (w- projow) must be in W and not in W. Unless its the zero vector. TRUE.

5. For each of the statements given below decide if it is true or false. If it is true explain

why. If it is false give a counterexample.
