

- 5. For each of the statements given below decide if it is true or false. If it is true explain why. If it is false give a counterexample.
- a) If A is a 2×2 matrix and v is an eigenvector of A corresponding to an eigenvalue λ then 2v is an eigenvector of A corresponding to the eigenvalue 2λ .
- b) If V is a subspace of \mathbb{R}^2 and w is a vector such that $\operatorname{proj}_V w = -w$ then w must be the zero vector.
- c) If A is a square matrix which is both symmetric and orthogonal then A^2 is the identity matrix.

d) If A and B are 2×2 matrices which are both orthogonally diagonalizable, then the matrix A + B is also orthogonally diagonalizable.

False , consider [2 3] $\lambda = 2$.

True, because projon & O if w is outhogonal to V.

and projection connot reverse a direction.)?

The oney case when projow = -w would be if w=0

because - w=0

True, ATEN' (outhogonal) A=AT (symmetric)

A.A. I (outhogonal)

(A). A = I since symmetric A=I

& True, since both A& B are nxn matrices, which are

bothogonally déagonizable, which means they have to be symmetric of $A = \begin{cases} x & m \ J & B = \begin{cases} p & x \ m & y \end{cases} \end{bmatrix}$

then AfB = [x+p m+r]

M+y g+q]

A+B is Symmetric & nxn

So outhogonally diagonizable.
